

REST API Testing Project Report

Tool: Postman

API: JSONPlaceholder

Purpose: Demonstrate practical API testing skills for a QA fresher portfolio.

Scope

CRUD operations, response validation, status codes, response time, JSON fields, environment variables, positive/negative scenarios and collection execution.

Test Coverage

Area	Coverage
GET	Users and posts retrieval
POST	Create post
PUT	Full update
PATCH	Partial update
DELETE	Delete resource
Negative	Invalid user/post IDs
Assertions	Status, body, response time
Documentation	25 test cases

Execution Note

The included Postman collection contains executable assertions. Run the collection in your own Postman workspace and replace the illustrative screenshots with actual execution screenshots before presenting the repository as completed hands-on work.

Interview Talking Points

Explain why each HTTP method is used, how assertions work, how environment variables avoid hard-coded values, how negative cases are selected, and how Collection Runner supports regression testing.
